Art Unit: 2882

Continuation of 11. does NOT place the application in condition for allowance because:

With regard to claim 1, the applicants argue that the grooves (221a, 222a) disclosed by Igarashi et al. do not serve to engage either indexing pins 211a or 243. Specifically, the applicants noted that the notch (222b) is separate from the collimator elements and the pins do not engage with the collimator elements themselves. The examiner respectfully disagrees. There is nothing in the claim that requires the collimator elements themselves to engage the pins. As indicated in the last office action (p. 5), the notched grooves (221b, 222b) are considered to be a portion of the collimator assembly.

With regard to claim 8, the applicants argue that the collimator module (220) is not a comb. The examiner respectfully disagrees. As defined by Merriam-Webster, a comb is a toothed instrument; there is no specific structural limitation. The collimator module, having a plurality of teeth, meets this definition.

With regard to claim 14, the applicants argue that the teeth disclosed by Igarashi et al. do not engage an indexing pin to align a scintillator array with the plurality of collimator plates. The examiner respectfully disagrees. Igarashi et al. disclosed a detector support (222) having at least one comb of alignment teeth (222a), the alignment teeth constructed to align the plurality of collimator plates, and the detector support is constructed to engage an indexing pin (243).

Therefore, the rejection is being maintained.
